

QFraud

The best protection against identity theft

QFraud is a **database** that contains precise information about **more than 24 million** urban homes, providing a unique set of variables to identify each house, and that they should be easily known by their residents or tenants.

This database has been designed so that any company can incorporate a series of fully configurable questions, in their online forms for contracting products or services.

When a user includes their address on these forms, they should be able to answer some easy, and **non-intrusive**, questions about where they live and obvious characteristics of their closest environment.

A criminal who has obtained an address fraudulently, or who intends to use an invented address, is very unlikely to be able to correctly answer certain random questions about that address, and within a limited range of time.

Companies can customize questions and cut-off points or thresholds, to decide whether a questionnaire is potentially fraudulent or not.

QFraud is delivered with all the valid answers for each house, ready to stop phishing attempts.

Features

Building

Information on the type of housing, size and construction characteristics

Surroundings

Information about the location and services around each home

Transportation

Information on public transport near a home

Health

Nearby medical services

Schools

Educational centers in the neighborhood

How is it sold?

The **QFraud** Database is sold as an Annual License for all homes (more than 24.8 million) distributed in 52 provinces and with all its variables and attributes.

Is it easy to integrate?

The **QFraud** database is extremely simple to integrate, since 52 flat files are provided in “.txt” format, one per province, with all fields separated by a delimiter.

The format of the **QFraud** database is homogeneous and standard for all provinces and variables, being able to import all homes with a single process.

In addition, an attribute file and a detailed manual are provided to facilitate the integration into any system and to explain each variable.

Are updates offered?

Quantumdata runs bi-monthly updates of the database, to incorporate new homes of the different Cadastres (they change twice a year), adjust market values, new points of interest and even new variables. It is perfectly feasible to receive any of these updates as often as desired.
